

WADAKH

0000

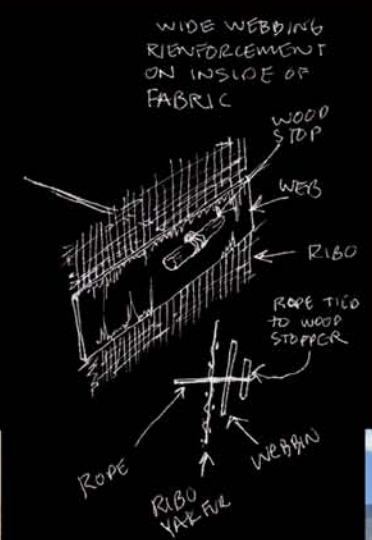

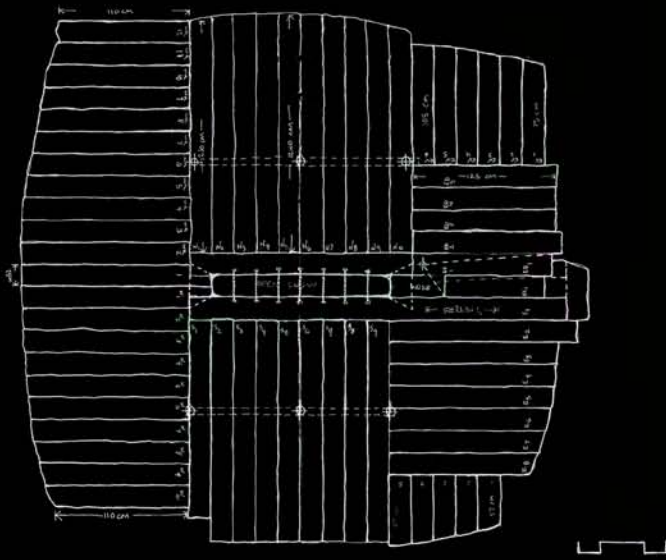

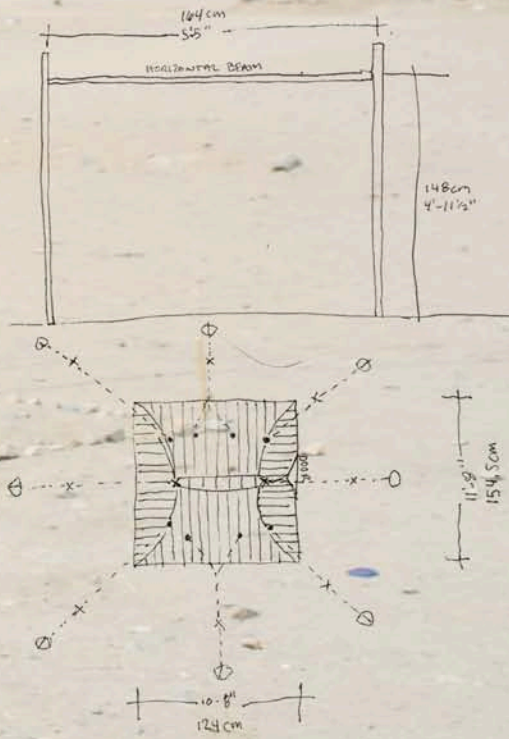

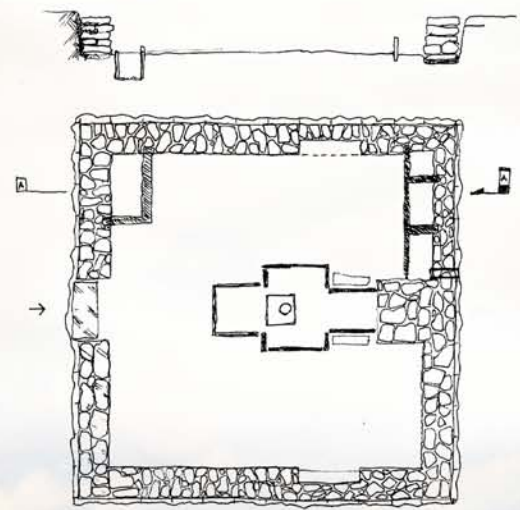

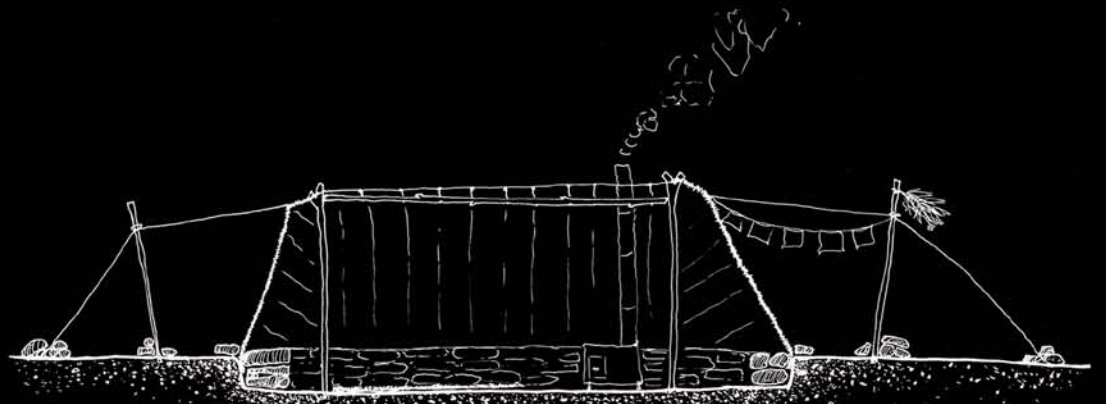

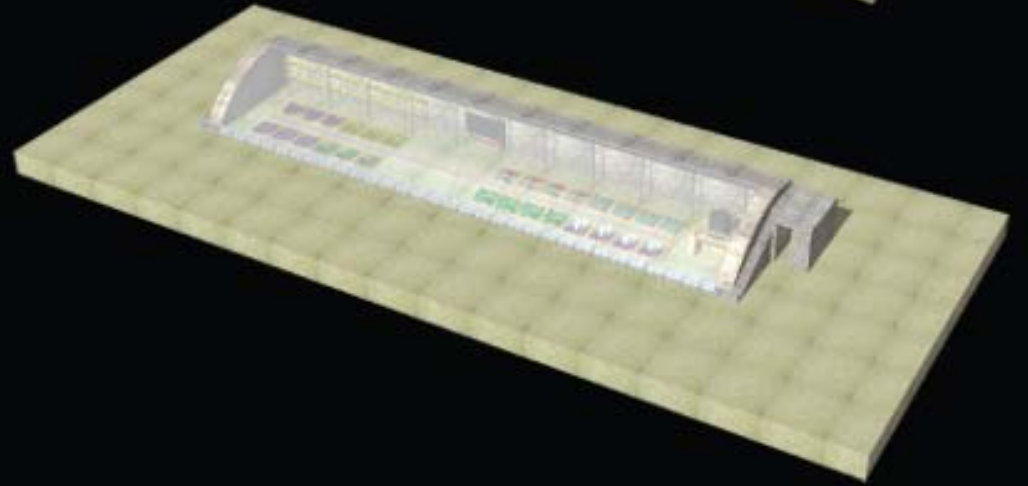

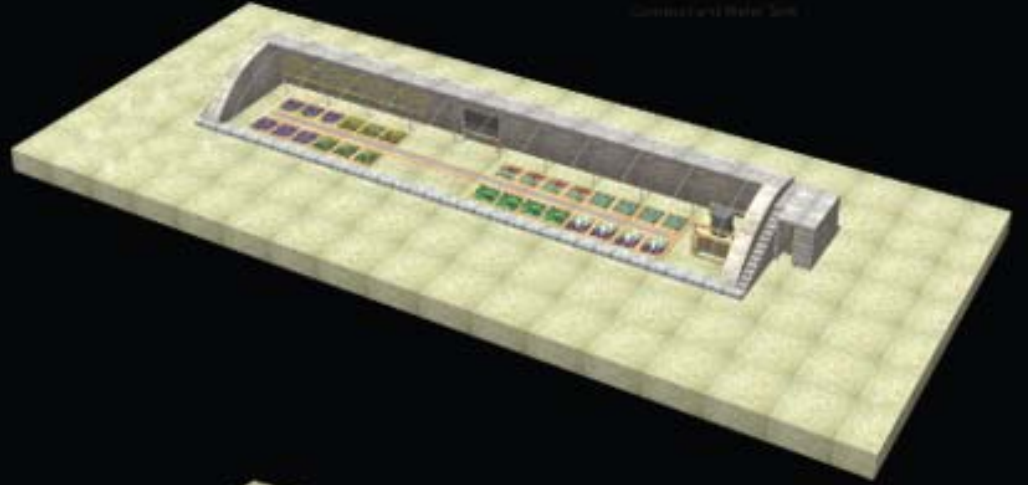

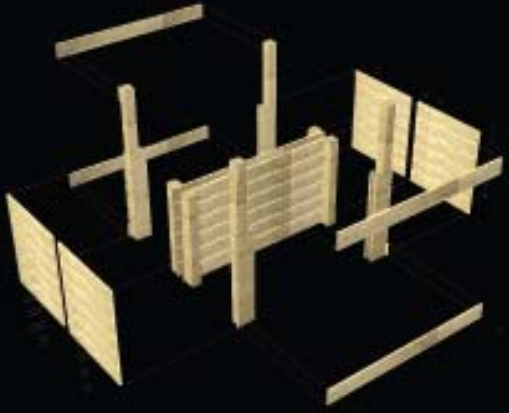

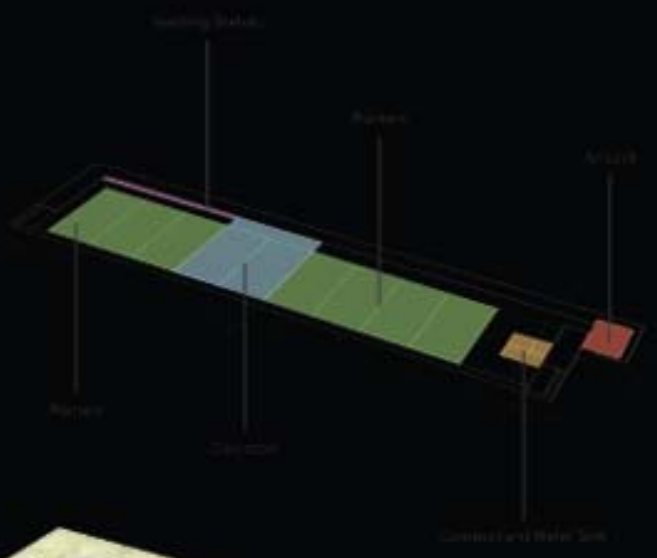

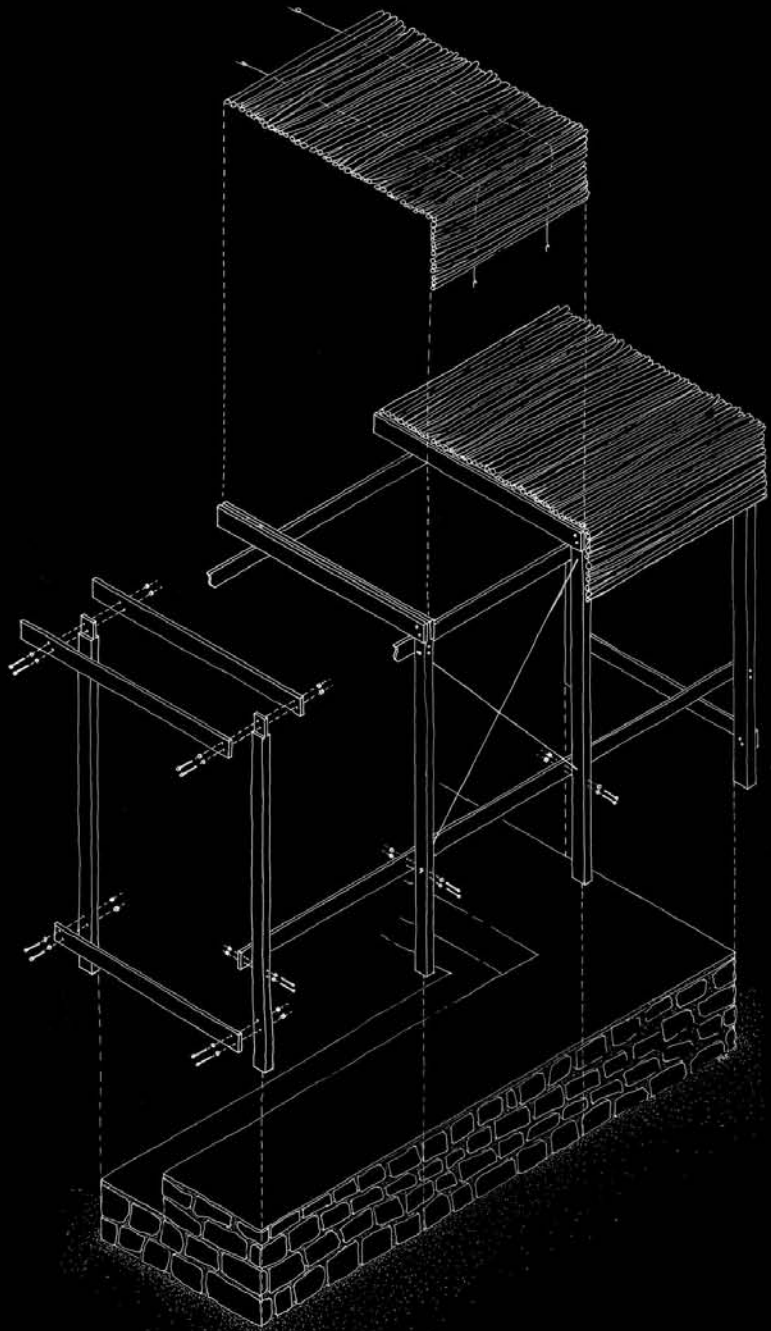

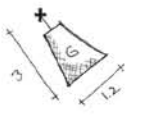

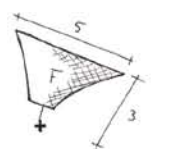

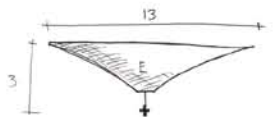

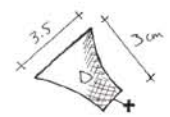

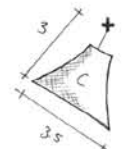

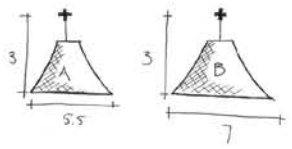

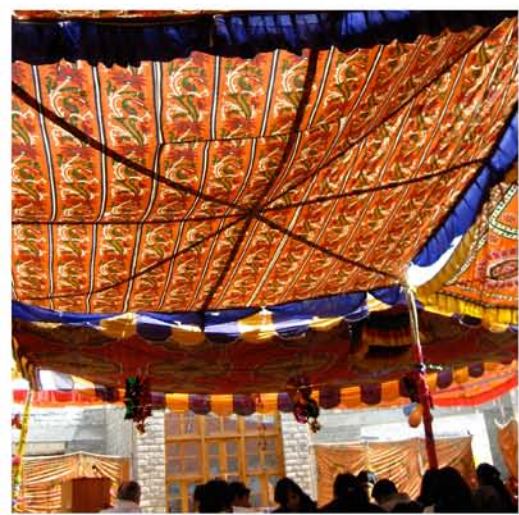

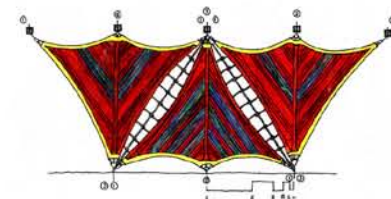

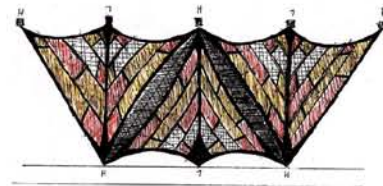

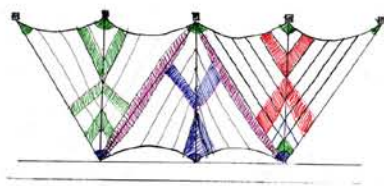

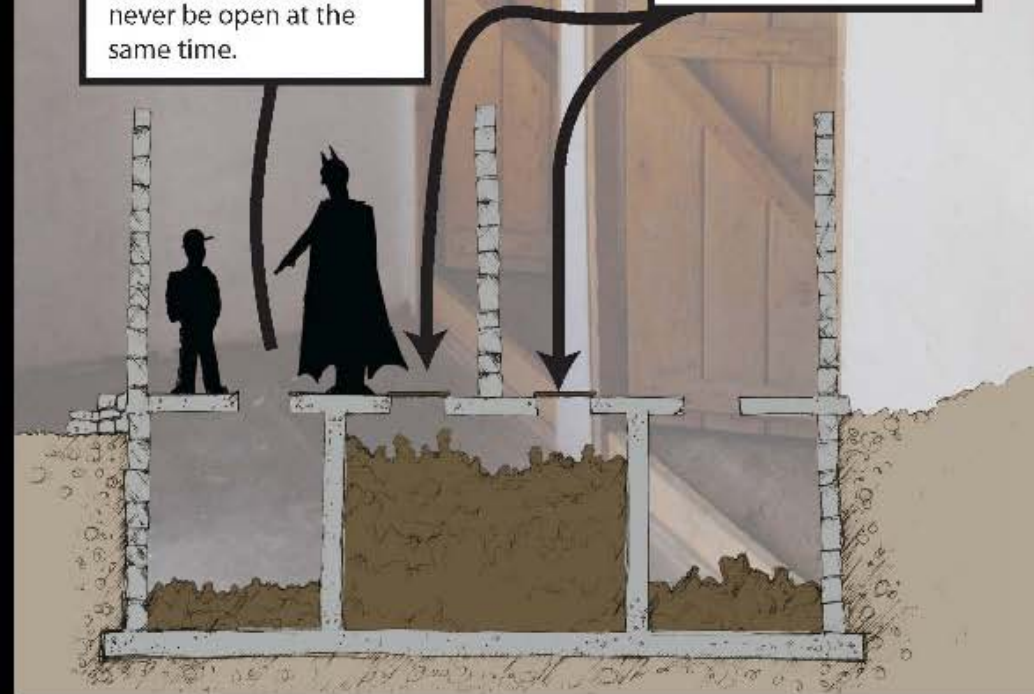

BATMAN

The composting toilets are a delicate balance of pathogens, which are any bacteria or virus that can harm humans, and the technology that is attempting to destroy the pathogens. When you put new waste in the system you start the cycle over.

As the open side fills the closed side will decompose. Both sides should never be open at the same time.

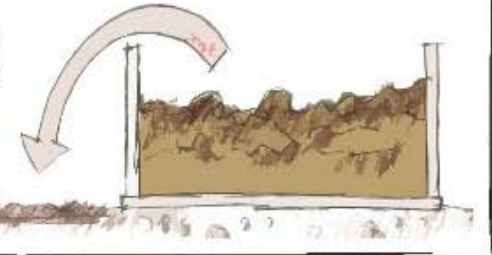

One side of the toilet must stay closed for six months for the waste to decompose completely so it can be used as soil.

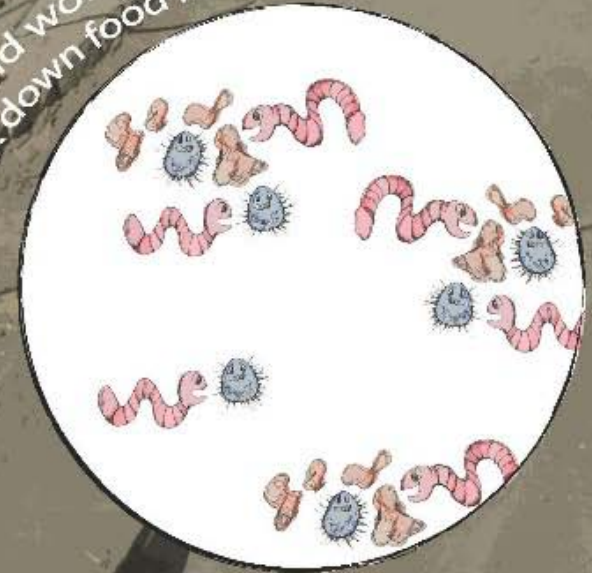

SPIDER-MAN

After removing the decomposed food from the bin it can be applied to the garden as fresh and nutrient rich soil. This will be an excellent source of plant food.

Bacteria and worms will help to break down food into dirt

The now empty compost bin can be filled once again to be turned back into usable garden soil.

How to Use the Solar Wall

In the cold winter months the vents and windows should be sealed tight during the day to keep the heat in. During the night, you should open the vents to allow the warm air into the room.

Winter Day

WINTER

The sun heats up the solar wall

During the winter days and nights the outside windows should be closed to allow for the solar wall to heat up the air inside.

Winter Night

If you follow these easy steps you too can control your resident solar wall. Just remember that **Red means closed** and **Green means open**.

During those hot summer days leave the vents and windows closed, but at night open up the window to let the cool breeze in. This way when you close up during the day it will be cool for the rest of the day.

Summer Day

SUMMER

The sun heats up the solar wall

The sun's heat escapes through the open windows

During the summer days and nights the outside windows should be left open to allow for the summer heat to escape.

Summer Night
